Why InfluxDB is building Flux

Paul Dix
@pauldix
paul@influxdata.com

- Query planner
- Query optimizer
- Turing complete language, VM, and query engine
- Multi-language support in Engine
- Multi-data source support
- InfluxDB, CLI, REPL, Go library

```
// get all data from the telegraf db
from(bucket:"telegraf/autogen")
  // filter that by the last hour
  |> range(start:-1h)
  // filter further by series with a specific measurement and field
  |> filter(fn: (r) => r._measurement == "cpu" and r._field == "usage_system")
```

```
// get all data from the telegraf db
from(bucket:"telegraf/autogen")
   // filter that by the last hour
   |> range(start:-1h)
   // filter further by series with a specific measurement and field
   |> filter(fn: (r) => r._measurement == "cpu" and r._field == "usage_system")
```

Named Arguments

```
// get 11 data from the telegraf db
from(bucket:"telegraf/autogen")
   // filter that by the last hour
   |> range(start:-1h)
   // filter further by series with a specific measurement and field
   |> filter(fn: (r) => r._measurement == "cpu" and r._field == "usage_system")
```

String Literals

```
// get all data rom the telegraf db
from(bucket:"telegraf/autogen")
   // filter that by the last hour
   |> range(start:-1h)
   // filter further by series with a specific measurement and field
   |> filter(fn: (r) => r._measurement == "cpu" and r._field == "usage_system")
```

Buckets, not DBs

```
// get all data from the telegraf db
from(bucket:"telegraf/autogen")
  // filter that by the last hour
  |> range(start:-1h)
  // filter further by series with a specific measurement and field
  |> filter(fn: (r) => r._measurement == "cpu" and r._field == "usage_system")
```

```
// get all data from the telegraf db
from(bucket:"telegraf/autogen")

// filter that by the last hour

range(start:-1h)
filter further by series with a specific measurement and field

filter(fn: (r) => r._measurement == "cpu" and r._field == "usage_system")
```

Pipe forward operator

```
// get all data from the telegraf db
from(bucket:"telegraf/autogen")
  // filter that by the last hour
  |> range(start:-1h)
  // filter further by series with a specific measurement and field
  |> filter(fn: (r) => r._measurement == "cpu" and r._field == "usage_system"
```

Anonymous Function

The journey...

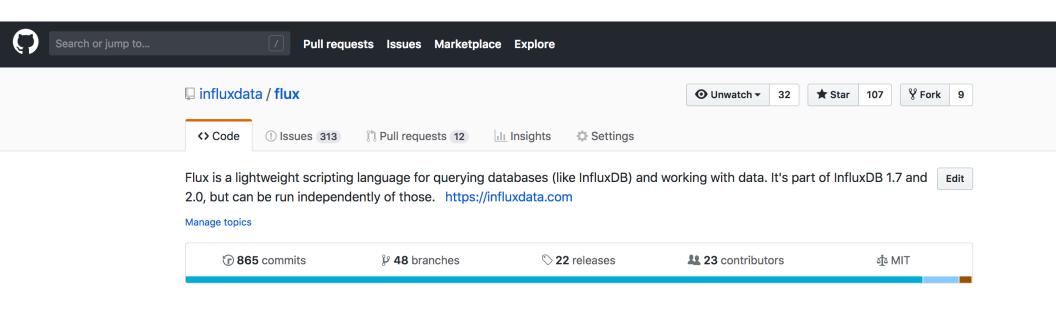

The design of IFQL, the New Influx Functional Query Language

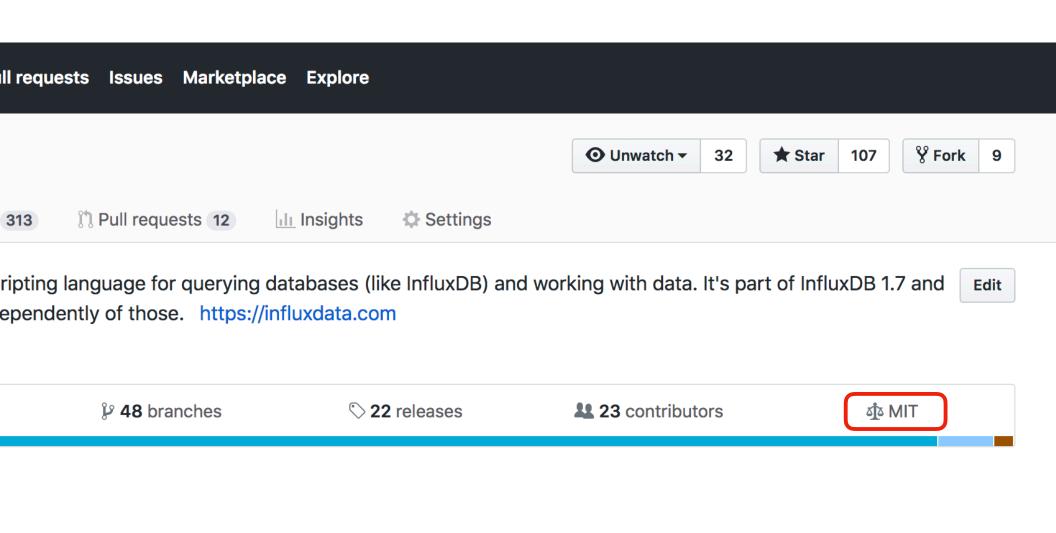

A new query language for InfluxDB

A new scripting & query language for InfluxDB

A new scripting & query language for InfluxDB

IFQL -> Flux

Why We're Building Flux, a New Data Scripting and Query Language

-tylerl on HN

"Perl is actually readable compared to that."

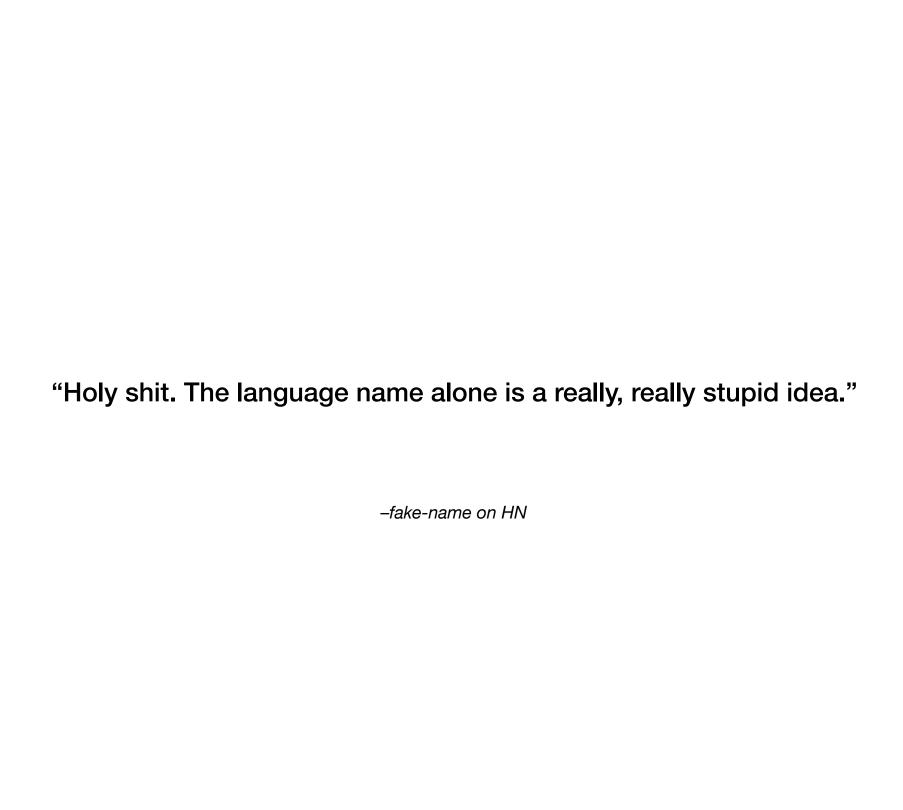

-petre in response to tylerl on HN

"SQL has a very solid ground in research - a lot of - in relational algebra. If you try to make a query language that is a dsl for anything without a really different data model underneath, you will accomplish nothing great."

-rs86 on HN

"The ultimate fantasy of every programmer is to a) invent a new language and b) force other people to use it. It's OK, we all get it, it's fine. But let's be honest about our motivations..."

-gaius on HN

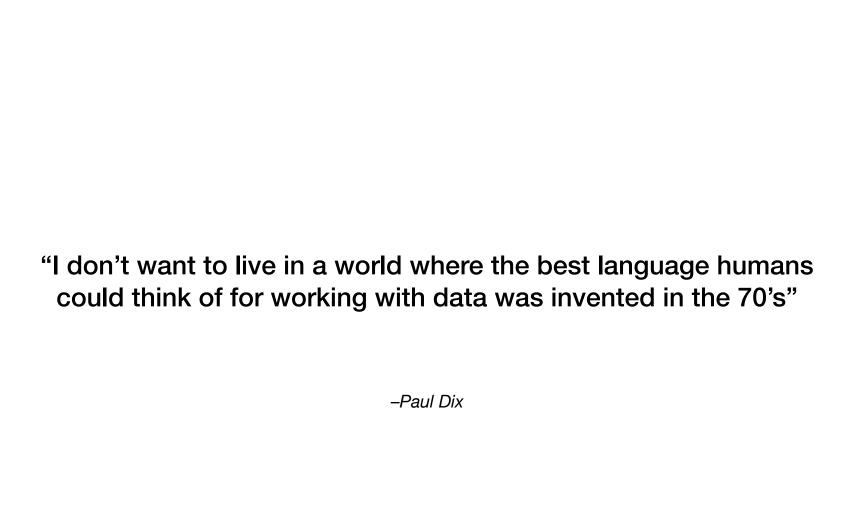

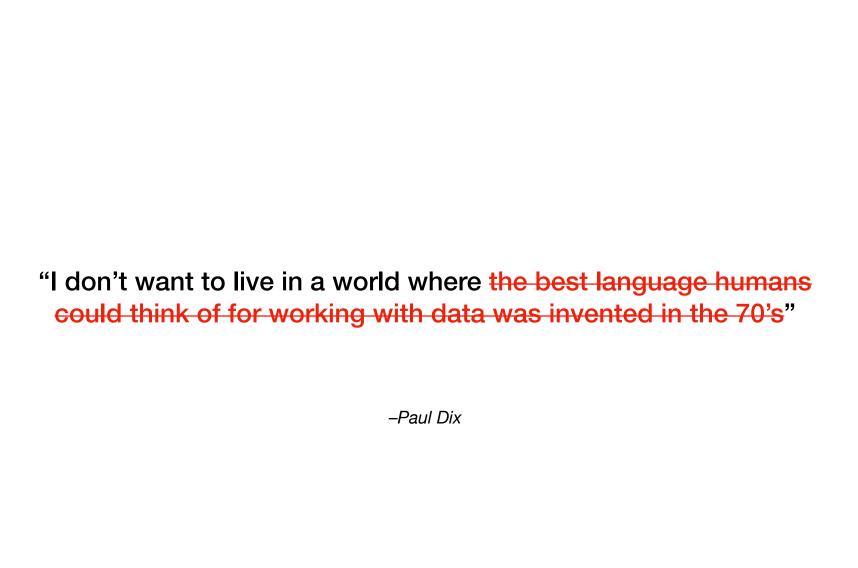

"It was a bad idea to focus on Flux vs SQL."

-lixtra on HN

Paul, don't be a jerk

!zeroSum()

"I don't want to live in a world where..."

A Native Go Library for Apache Arrow ∞

Published 22 Mar 2018

By The Apache Arrow PMC ()

Since launching in early 2016, Apache Arrow has been growing fast. We have made nine major releases through the efforcontributors. The project's scope has also expanded. We began by focusing on the development of the standardized inwhich now serves as a pillar of the project. Since then, we have been growing into a more general cross-language platforthrough new additions to the project like the Plasma shared memory object store. A primary goal of the project is to enal process and move data fast.

Tables Everywhere

```
from(bucket: "foo")
    |> range(start: -10m)
    |> filter(fn: (r) => r._measurement == "cpu")
    |> group(columns: ["_measurement"])
    |> sort(columns: ["_value"])
```

Sorting by value!

Group by anything

Measurements, tags, fields don't matter

Beyond Queries

```
option task = {
  name: "email alert digest",
  cron: "0 5 * * 0"
import "smtp"
body = ""
from(bucket: "alerts")
  > range(start: -24h)
  |> filter(fn: (r) => (r.level == "warn" or r.level == "critical") and r. field == "message")
  |> group(columns: ["alert"])
  > count()
  > group()
  |> map(fn: (r) => body = body + "Alert {r.alert} triggered {r. value} times\n")
smtp.to(
  config: loadSecret(name: "smtp digest"),
 to: "alerts@influxdata.com",
 title: "Alert digest for {now()}",
 body: message)
```

```
option task = {
  name: "email alert digest",
                                                                     tasks
  cron: "0 5 * * 0"
import "smtp
body = ""
from(bucket: "alerts")
   > range(start: -24h)
   |> filter(fn: (r) => (r.level == "warn" or r.level == "critical") and r. field == "message")
   |> group(columns: ["alert"])
   > count()
   > group()
   |> map(fn: (r) => body = body + "Alert {r.alert} triggered {r. value} times\n")
smtp.to(
  config: loadSecret(name: "smtp digest"),
  to: "alerts@influxdata.com",
  title: "Alert digest for {now()}",
  body: message)
```

```
option task = {
  name: "email alert digest",
  cron: "0 5 * * 0"
                                                      cron scheduling

  > count()
  > group()
  |> map(fn: (r) => body = body + "Alert {r.alert} triggered {r. value} times\n")
                                                            Store secrets in a
smtp.to(
                                                                 store like Vault
  config: loadSecret(name: "smtp digest"),
  to: "alerts@influxdata.com",
 title: "Alert digest for {now()}",
  body: message)
```

Where we are...

- 1. Make it powerful
- 2. Make it easy
- 3. Make it fast

- 1. Make it powerful
- 2. Make it easy
- 3. Make it fast

Flux in InfluxDB 1.7

InfluxDB 2.0

- Multi data source
- Multi data sink
- Turing complete
- Liberally licensed
- Not tied to InfluxDB

Bigger than InfluxDB!

Thank you

Paul Dix
